

## FORMATION 2 – INFORMATION SYSTEMS

## **DRAFT EDUCATORS BRIEFING 2017/18**

|    | Торіс   | Guidelines   |
|----|---|--|
| 1. | Comments on<br>Performance in<br>2017<br>Examinations<br>(Based on April<br>sitting only) | There has been a marked improvement in quality, and often in the average scores, with many more students showing a good level of technical knowledge and the ability to apply this, in comparison to previous sittings. Both the students and educators should be commended for this. Some students' answers were too brief, often at the expense of relating the technical knowledge to the context of the question, and this may be something to develop.  |
|    |   | In contrast, students who failed generally did so because they did not<br>demonstrate technical knowledge of the paper's content, or demonstrated a<br>very basic level of knowledge that did not allow them to respond to given<br>contexts, or to discuss that content in an appropriate level of detail.  |
|    |   | It is of concern that historically the August pass rates remain much lower than April pass rates, despite these exams being set to the same standard.  |
|    |   | There is scope for improvement in student responses to the (compulsory) case study questions. In case study questions, students should expect to draw on the material provided in the case to respond to the questions posed – this application is central to the aims of this subject. If they fail to do so and give answers that re-state technical content without applying it, they will not achieve good marks in these questions. Similarly very general answers that fail to demonstrate any subject-specific knowledge also score low marks. An article on case study questions will be published later in the year and I hope this will be helpful to students preparing for these.  |
|    |   | Similar comments can be made in respect of the optional questions where students are asked to relate technical content to a specific scenario – such questions reinforce the need for students to be comfortable in <i>applying</i> technical knowledge: generic answers based on learned off descriptions or lists (e.g. of pros and cons) will not demonstrate this.   |
|    |   | Examination technique continues to improve with the vast majority attempting all relevant parts of each question, however some continue answer too few or too many questions (e.g. all four optional questions for Section B). Carefully following exam instructions (which have not changed in recent years) is very important, particularly for marginal candidates. Engagement with past papers should also address this. I would continue to encourage students to consider exam technique and timing, to avoid overly long responses for few marks, or overly brief responses for many marks. As in the previous papers I again noted that unnecessary time was spent by some students rewriting the question in the answer booklet – a clearly |

|  |                        | identified question number is sufficient.   |  |
|--|------------------------|---|--|
| 2.   | Learning<br>Objectives | The aim of this subject is for students to develop an understanding of the role and application of information systems and information technology in the management and control of organisations. Students will develop their understanding of selecting and advising on the implementation of appropriate systems, processes, controls and solutions in organisations today. The Learning Outcomes are published in the syllabus.  |  |
| 3.   | Syllabus<br>Changes    | The syllabus remains the same as for the previous year, and the<br>emphasis remains on the application of information systems and information<br>technology. This emphasis enables educators and students to concentrate<br>on how systems and technologies support organisational activities,<br>performance and growth.<br>The recommended core text is:<br>Laudon and Laudon, Management Information Systems - Global<br>edition, Publ. Prentice Hall 2015 / ISBN 978-1292094007 14th edition. |  |
| 4.Format of the<br>Examination<br>Papers for 2018The overall format of the examination will be the same as in<br>years. The examination will be unseen, closed book and three h<br>duration. It will be divided into two sections: |                        |   |  |
|  |                        | Section A will consist of two compulsory questions.   |  |
|  |                        | Question 1 is a compulsory question. It will be based on an unseen case<br>study set in a real life business context, and will be worth 25 marks. This<br>will primarily assess students' ability to apply their knowledge of the<br><b>core</b> areas identified in the Education Focus below. However, it will also<br>expect students to draw on knowledge of the <b>important</b> areas also<br>identified in the Education Focus.  |  |
|  |                        | Question 2 is also compulsory. It will be a 15 mark question, with students expected to write notes on 3 from 5 questions with 5 marks each. As in previous years, Question 2 facilitates the examination of a range of topics across different syllabus areas. The topics will be drawn from the <b>core</b> and <b>important</b> areas identified in the Education Focus, and will assess students' knowledge of the topic and ability to apply that topic to the specific context.             |  |
|  |                        | • Section B will have four 20 mark questions. Students will be required to answer 3 of these.   |  |
|  |                        | Each of the questions in Section B will have, as its major element, one of the <b>core</b> areas identified in the Education Focus. Approximately one third of the marks will be allocated to topics in the <b>important</b> areas as well as other parts of the syllabus.  |  |
|  |                        | The examination format and an indication of the marks allocation are also<br>stated in the syllabus. The format will be the same as outlined in the<br>'Assessment Strategy' section of the syllabus.   |  |

| _  |                                   |  |
|----|-----------------------------------|--|
| 5. | Education<br>Focus for<br>2017/18 | Educators are expected to cover all aspects of the syllabus so that students get a full understanding of selecting and advising on the implementation of appropriate systems, processes, controls and solutions in a business environment. In order to facilitate educators and students, a number of <b>core</b> and <b>important</b> areas have been identified, <b>and these are the same as in previous years.</b> Together these provide a structure that enables educators to achieve the learning outcomes presented in the 2017/18 syllabus. |
|    |                                   | Core   |
|    |                                   | <ol> <li>The role of information systems in today's competitive business<br/>environment, and in particular the links between information systems<br/>and business performance. This includes the strategic business<br/>objectives of information systems, and the organisational, management<br/>and technological dimensions of systems deployed in today's business<br/>environment.</li> </ol>  |
|    |                                   | <ol> <li>Enterprise applications and systems, and in particular information<br/>systems used for enterprise resource planning (ERP), supply chain<br/>management (SCM) and client/customer relationship management<br/>(CRM), plus the management challenges to building and using these.</li> </ol>   |
|    |                                   | 3. The use of information systems in decision making and decision support, including business intelligence tools and analytics. In this context it is important to understand data and information storage, with emphasis on current trends, warehousing and mining, and the management of data and information resources.   |
|    |                                   | 4. Understanding contemporary information technology trends and their implications for (business) organisations. These trends include Internet technologies that facilitate the management of business processes, the use of mobile platforms and applications in business, cloud computing and social media.  |
|    |                                   | Important  |
|    |                                   | <ol> <li>E-business and collaboration, including global e-business and a<br/>knowledge of the tools/technologies used. This covers the business<br/>objectives, applications, business models and technologies of e-<br/>commerce, as well as the ways in which the Internet impacts<br/>organisations and business firms, both economically and<br/>organisationally.</li> </ol>  |
|    |                                   | <ol> <li>Using information systems to achieve competitive advantage, including<br/>the use of Porter's Five Forces and Value Chain models.</li> </ol>  |
|    |                                   | <ol> <li>Ethical and social issues in information systems, including the Data<br/>Protection Act.</li> </ol>   |
|    |                                   | 4. Securing information systems, and in particular frameworks for security<br>and control. The latter covers all aspects of the systems and technology<br>infrastructure (hardware, software, data, people and processes), as well<br>as all application stages (input, storage, processing and output).   |

|  | 5.         | Managing knowledge. Here the emphasis is on knowledge management<br>and the different types of knowledge management systems rather than<br>intelligent techniques or the specifics of different knowledge work<br>systems.            |
|--|------------|---|
|  | 6.         | Building and deploying information systems. This covers the planning of organisational change, stages in system development, and approaches to system building or acquisition.  |
|  | 7.         | Establishing the value of information systems in business, and knowing how to manage information systems projects.  |
|  | 8.         | eXtensible Business Reporting Language (XBRL) as a standard for exchanging business information, and its role in communicating financial information among internal and external users.   |
|  | thr<br>act | ucators are encouraged, where possible, to actively engage students<br>ough the use of discussion questions, case studies and short group<br>ivities in order to address the learning outcomes of critical analysis of<br>se studies. |
